flytboj (floating buoy) is a custom mod for Ikea's Pelarboj table light, which is based off of a simple non-addressable LED array. However the main downside/area of improvement is the fact that the original pcb was static and only had presets, which is exactly what this project accomplishes!

You can either use a 24v barrel jack or 4000mAh battery to supply power and then the xiao esp to connect to it and control it from the comfort of **anywhere!**
